Transcript of initial interview with Ryan Zhang:

Me: Do you want a python program or a website
Ryan: Does this affect how you do it?
Me: Yes
Ryan: What's easier?
Me: Python
Ryan: Python is good
Me: How do you expect to use the program
Ryan: I input numbers and it gives me averages
Me: Is there anything else you want?
Ryan: Not that I can think of I'll keep you updated
Me: Sounds good that's all I need thanks

Transcript of final interview with Ryan Zhang, this interview was done after the program was tested on a laptop via USB drive:

Me: What did you like about the program?
Ryan: I liked how the program was user friendly and also seemed very professional. It was accurate and also provided useful information. I also liked how the program had a variety of options relating to its content
Me: How could the program be improved?
Ryan: From my experience, I did not see any large areas requiring improvement. If I had to pick something to improve, I would put small descriptions for some options/terms. However, once again, this is nitpicking and I was quite satisfied with the program that I was provided with
Me: What would you say are some extra features or options that could be added to improve the program?
Ryan: In the future, an extra feature that would be nice to have would be an option to update stats live as the game is being played. Of course this would be a future project addition, and the current project is fundamentally a great stat tracker for common use.
